

# ePortfolio

Advanced Internet Reporting and Analysis

**AMSI ePortfolio** is an integrated web-based property consolidation analysis tool that gives you the ability to view consolidated operational and financial data from across your portfolio. With ePortfolio you can easily view data at the highest level of consolidation and drill down into specific areas of interest all the way to the unit level. You can define personal reports and take advantage of powerful charting capabilities to make data useful and accessible to anyone you wish.

ePortfolio allows you to harness large amounts of information generated by your organization in order to extract the specific analysis you need to manage the progress of your business.

### Analyze Information from Multiple Perspectives

- ePortfolio allows you to view analytical information through a company hierarchy that you define such as: entire portfolio/division or region/specific properties/specific units.

### View Data in Graphical Format

- ePortfolio offers mixed, bubble, 3D, and dual-axis charts that include the ability to move from summary data to detail data. Users can drill down to investigate areas of interest, and then export data to Excel to present it in multiple ways.

### Produce and Distribute Reports with Ease

- Reports can be generated in any of the following formats: HTML, RTF, PDF or Excel. Delivery methods can include email, network servers, printers, or web portal, either alone or in combination. Using templates and built-in formats, you can define date ranges, frequencies, and times for reports to be generated and delivered.

### Highlight Areas of Concern

- ePortfolio includes advanced exception reporting and alerting capabilities. The application uses color-coding as performance indicators to highlight areas that merit management attention and may otherwise go undetected.

### Customize Views that Work for You

- ePortfolio uses a standard web interface and has a built-in QuickView feature that allows you to instantly view and analyze your database. Prior to fully deploying the application, QuickView can be used to explore the types of views best suited to your business in order for you to customize your set up. Views can be further customized through scripting by the AMSI professional services team.
